

Softland ERP Operations Area//

Project Control Module

The Project Control Module is aimed at companies from the construction sector and related industries. It is a software solution that allows adequate and accurate tracking of the budget set in your project, regardless of its nature.

With this module, you can control each stage of a project and the costs involved in each stage, comparing them against the budget that was initially set. This record is achieved by a real integration between the budget of each project and the management systems, such as inventory, payroll and accounting. Thus, transactions are entered only once and provide information to both the administrative and project control areas.

Features:

- Capacity to specify the budget set for a project and each of its stages.
- Coding stage levels (phases or activities) flexibility of each project type.
- Recording of work progress in numbers or percentages.
- Capacity to record changes and make adjustments that match every budget, keeping a version control.
- Integration to actual cost records in actual operation (inventory, purchasing, payroll and accounting).
- Subcontracts control.
- Query and progress reports capability, comparison between budgeted and actual expenses and variations.
- Project Control is mainly associated with the following modules of Softland ERP:
 - a) General Accounting: Use of cost centers as project identifiers.
 - b) Inventory: It allows loading materials consumption to specific projects.
 - c) Payroll Control: It records the hours per project and phase and the subsequent distribution of labor costs associated with a project.
 - d) Accounts Payable: Commitments or subcontracts control associated with a project.
 - e) Purchases: When the purchase is made on specific projects.
