

Softland ERP Management Area//

Softland Alerts

Softland Alerts is a tool designed to proactively support the work of decision-makers in the companies that use Softland ERP for their administration duties. Regardless of the order or consistency in the different processes within the company, the day to day activities demand taking control and reacting immediately to situations as well as critical and important events, such as inventories below the desired levels, increase in the balance of a client, delays in production, sales above what was anticipated and balances in bank accounts that require redirecting funds, among others.

The technology incorporated in Softland Alerts allows you to configure with incredible flexibility and ease which events and situations should be reported to the decision-makers in the company, substantially reducing reaction times and giving the company a competitive advantage, which allows you to decrease the costs generated by lack of actions in a timely manner.

Features:

- **High flexibility:** It is possible to incorporate alerts of very diverse nature that adapt to the company's specific requirements and needs.
- **Appropriate means:** Softland Alerts allows you to run different messages and notifications to the decision-makers within the organization, incorporating them into the tools you use everyday. Alerts can be displayed in the work panel of Softland ERP or they are sent directly to e-mail accounts, generating a constant flow of information.
- **Management:** Alerts are manageable, that is to say, the managers will be able to check not only that the people are being notified, but also to make sure that the alert has been seen in an effective manner.
- **Timely information:** The frequency of the alerts is fully configurable and independent for each one of them. The information is sent in a natural way to the pace of your organization's work.
- **Multiplicity:** The number of alerts depends only on the limitations of your platform. You will be able to maintain as many alerts as you deem necessary, including the ability of parallel execution.
- **Full integration:** The product easily integrates with the modules of Softland ERP. This allows you to generate alerts for different types of processes and users, following the same philosophy of flexibility and adaptability present in Softland ERP.
- **Easy to implement:** It has easily identifiable visual guides that make it very simple to use and adapt to the needs and requirements of the company and its users.
- **Reports:** It is possible to generate reports with listings of the alerts that are configured by the administrator of the system, allowing you to know all the critical actions within your company. You can also know when and how often they are performed.
